

MATTER WHEEL EXPLAINER

1. WHEEL HUB

MATTER's original hub. Seen in all wheel sizes including 125mm. The hollow core is made from two separate pieces which are sonic welded together. Perfect for use in fast marathons or road racing, where top speed is critical.

A more flexible option to the standard hollow c core for 125mm. Similar to the hollow core, but with additional holes. Wheels with this hub are the perfect all-round compromise between stiffness and flex.

An ALU core is for skaters that want the ultimate stiffness. It will be very fast rolling in a straight line and on a perfectly smooth road. However, the skater will need to compromise on the ability to steer the wheels and the added weight. It is also only recommended for larger skaters.

A track specific hub, with optimized flex in one direction to mirror to the one direction of track racing.

A flexible single piece hub. MATTER's IMAGE wheels are the perfect long distance training wheel, or for rookie marathon racers looking for an instant performance boost.
